

Clear Laminated Glass

Clear laminated glass consists of two or more layers of glass with an interlayer, usually made of polyvinyl butyral (PVB). This interlayer holds the layers together even when broken, providing enhanced safety and security.

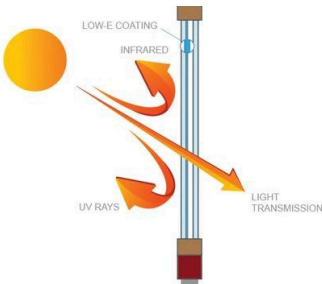

Double Glazed Glass

Double glazed glass comprises two panes of glass separated by a spacer filled with air or gas. This design improves insulation, reducing heat transfer and enhancing energy efficiency.

Low Emissivity (Low-E) Glass

Low emissivity glass has a special coating that reflects infrared light, keeping heat inside during winter and outside during summer. This helps maintain a consistent indoor temperature and enhances energy efficiency.

Patterned Glass

Patterned glass features a textured or decorative surface, providing privacy while allowing light to pass through. It is often used in bathrooms, doors, and decorative windows.

Toughened Glass

Toughened glass is heat-treated to increase its strength. When broken, it shatters into small, blunt pieces rather than sharp shards, making it safer for use in areas prone to impact.

Acoustic Glass

Acoustic glass is designed to reduce noise levels, consisting of multiple layers of glass with interlayers that dampen sound vibrations. It is ideal for use in environments where noise reduction is essential.
